

IN THE CLAIMS:

Please note that all claims currently pending and under consideration in the referenced application are shown below, in clean form, for clarity.

Please amend the claims as follows:

1. (Twice Amended) A method of electrically connecting a semiconductor die to a substrate, comprising:  
providing one of a semiconductor die having a surface having a plurality of bond pads extending along a longitudinal axis of said die on said surface and a semiconductor die having a surface having a plurality of bond pads extending in a leads-over configuration on said surface;  
providing a substrate having a die side surface, a second attachment surface, at least one via extending through the substrate from the die side surface to the second attachment surface, a plurality of circuits, and a plurality of bond pads located on the second attachment surface of the substrate;  
attaching the surface having a plurality of bond pads thereon of the semiconductor die to the die side surface of said substrate; and  
connecting said plurality of bond pads of the semiconductor die to said plurality of bond pads of said substrate using a plurality of wire bonds, said plurality of wire bonds extending through said at least one via extending through said substrate.

2. The method of claim 1, further comprising:  
applying an adhesive to a portion of the die side of the substrate to attach the semiconductor die thereto.

3. The method of claim 1, further comprising:  
filling at least a portion of the via in the substrate with a sealant.

4. The method of claim 1, further comprising:  
filling the via in the substrate with a sealant.

5. A method of electrically connecting a semiconductor die to a master board, comprising:  
providing a semiconductor die having a plurality of bond pads thereon;  
providing a master board having a plurality of circuit traces thereon;  
providing a board having a die side surface, a second attachment surface, at least one via  
extending through the board from the die side surface to the second attachment surface, a  
plurality of circuits, and a plurality of bond pads located on the second attachment surface  
of the board;  
providing a plurality of electrical connectors for connecting the plurality of bond pads located on  
the second attachment surface of the board to the circuit traces of the master board;  
attaching said semiconductor die to a portion of the die side surface of the board;  
connecting said plurality of bond pads of said semiconductor die to said plurality of bond pads of  
said board using a plurality of wire bonds, said plurality of wire bonds extending through  
the at least one via extending through then board; and  
connecting said board and master board using said plurality of electrical connectors on said board  
to said plurality of circuit traces on said master board.

6. The method of claim 5, wherein the board includes a plurality of vias extending  
therethrough.

7. The method of claim 5, wherein the plurality of electrical connectors comprise  
solder balls.

~~2~~  
~~Sub E~~

8. (Twice Amended) A method of electrically connecting at least two semiconductor die to a substrate, comprising:

providing at least two semiconductor die, each semiconductor die being one of a semiconductor die having a surface having a plurality of bond pads extending along a longitudinal axis of said die on said surface and a semiconductor die having a surface having a plurality of bond pads extending in a leads-over configuration on said surface;

providing a substrate having a die side surface, a second attachment surface, at least two vias extending through the substrate from the die side surface to the second attachment surface, a plurality of circuits, and a plurality of bond pads located on the second attachment surface of the substrate;

attaching the surface having a plurality of bond pads thereon of a semiconductor die of the at least two semiconductor die to the die side surface of the substrate having the plurality of bond pads of the semiconductor die located over one of the at least two vias extending through the substrate; and

connecting said plurality of bond pads of the semiconductor die to said plurality of bond pads of said substrate using a plurality of wire bonds, said plurality of wire bonds extending through the one via extending through the board of the at least two vias extending through the substrate.

~~4~~

9. The method of claim 8, further comprising:

applying an adhesive to a portion of the die side of the substrate to attach each semiconductor die thereto.

10. The method of claim 8, further comprising:

filling at least a portion of each via in the substrate with a sealant.

11. The method of claim 8, further comprising:  
filling each via in the substrate with a sealant.

~~Sub E4~~ 12. (Amended) A method of electrically connecting a plurality of semiconductor die to a master board, comprising:  
providing a plurality of semiconductor die, each semiconductor die being a semiconductor die having a plurality of bond pads extending along a longitudinal axis of said die on said surface and a semiconductor die having a surface having a plurality of bond pads extending in a leads-over configuration on said surface;  
providing a master board having a plurality of circuit traces thereon;  
providing a board having a die side surface, a second attachment surface, a plurality of vias extending through the board from the die side surface to the second attachment surface, a plurality of circuits, and a plurality of bond pads located on the second attachment surface of the board;  
providing a plurality of electrical connectors for connecting the plurality of bond pads located on the second attachment surface of the board to the circuit traces of the master board;  
attaching each semiconductor die of the plurality of semiconductor die to a portion of the die side surface of the board;  
connecting said plurality of bond pads of each semiconductor die to said plurality of bond pads of said board using a plurality of wire bonds, said plurality of wire bonds extending through the a via extending through then board; and  
connecting said board and master board using said plurality of electrical connectors on said board to said plurality of circuit traces on said master board.

13. The method of claim 12, wherein the plurality of electrical connectors comprise solder balls.

14. The method of claim 12, wherein the plurality of electrical connectors comprise pins.

15. The method of claim 12, further comprising:  
filling at least a portion of each via in the board with a sealant.

16. The method of claim 12, further comprising:  
filling each via in the board with a sealant.

 26. (Twice Amended) A method of attaching a semiconductor die to a substrate, comprising:  
providing one of a semiconductor die having a surface having at least one bond [pads] pad located along a longitudinal axis of said die on said surface and a semiconductor die having a surface having at least one bond pad extending in a leads-over configuration on said surface;  
providing a substrate having a die side surface, a second attachment surface, at least one via extending through the board from the die side surface to the second attachment surface, a plurality of circuits, and at least one bond pad located on the second attachment surface of the substrate;  
attaching the surface having at least one bond pad thereon of the semiconductor die to the die side surface of said substrate; and  
connecting said at least one bond pad of the semiconductor die to said at least one bond pad of said substrate using at least one wire bond, said at least one wire bond extending through said at least one via extending through said substrate.

27. The method of claim 26, further comprising:  
applying an adhesive to a portion of the die side of the substrate to attach the semiconductor die thereto.

28. The method of claim 26, further comprising:  
filling at least a portion of the via in the substrate with a sealant.

29. The method of claim 26, further comprising:  
filling the via in the substrate with a sealant.

30. (Amended) A method of attaching a semiconductor die to a master board, comprising:  
providing a semiconductor die having at least one bond pad thereon;  
providing a master board having at least one circuit trace thereon;  
providing a board having a die side surface, a second attachment surface, at least one via extending through the board from the die side surface to the second attachment surface, at least one circuit, and at least one bond pad located on the second attachment surface of the board;  
providing at least one electrical connector for connecting the at least one bond pad located on the second attachment surface of the board to the at least one circuit trace of the master board;  
attaching said semiconductor die to a portion of the die side surface of the board;  
connecting said at least one bond pad of said semiconductor die to said at least one bond pad of said board using at least one wire bond, said at least one wire bond extending through the at least one via extending through then board; and  
connecting said board and master board using said at least one electrical connector on said board to said at least one circuit trace on said master board.

31. The method of claim 30, wherein the board includes a plurality of vias extending therethrough.

32. The method of claim 30, wherein the at least one electrical connector comprises at least one solder ball.

 33. (Twice Amended) A method of attaching at least two semiconductor die to a substrate, comprising:  
providing at least two semiconductor die, each semiconductor die being one of a semiconductor die having a surface having at least one bond pad extending along a longitudinal axis of said die on said surface and a semiconductor die having a surface having at least one bond pad extending in a leads-over configuration on said surface;  
providing a substrate having a die side surface, a second attachment surface, at least two vias extending through the substrate from the die side surface to the second attachment surface, at least two circuits, and at least two bond pads located on the second attachment surface of the substrate;  
attaching the surface having at least one bond pad thereon of a semiconductor die of the at least two semiconductor die to the die side surface of the substrate having the at least one bond pad of the semiconductor die located over one of the at least two vias extending through the substrate; and  
connecting said at least one of each of the semiconductor die to said at least two bond pads of said substrate using at least two wire bonds, at least one wire bond of said at least two wire bonds extending through the one via extending through the board of the at least two vias extending through the substrate.

34. The method of claim 33, further comprising:  
applying an adhesive to a portion of the die side of the substrate to attach each semiconductor die thereto.

35. The method of claim 33, further comprising:  
filling at least a portion of each via in the substrate with a sealant.

36. The method of claim 33, further comprising:  
filling each via in the substrate with a sealant.

28 37. (Amended) A method of attaching a plurality of semiconductor die to a master board, comprising:  
providing a plurality of semiconductor die, each semiconductor die being one of a semiconductor die having at least one bond pad extending along a longitudinal axis of said die on said surface and a semiconductor die having a surface having a plurality of bond pads extending in a leads-over configuration on said surface;  
providing a master board having a plurality of circuit traces thereon;  
providing a board having a die side surface, a second attachment surface, a plurality of vias extending through the board from the die side surface to the second attachment surface, a plurality of circuits, and a plurality of bond pads located on the second attachment surface of the board;  
providing a plurality of electrical connectors for connecting the plurality of bond pads located on the second attachment surface of the board to the circuit traces of the master board;  
attaching each semiconductor die of the plurality of semiconductor die to a portion of the die side surface of the board;

connecting said at least one bond pad of each semiconductor die to said plurality of bond pads of said board using a plurality of wire bonds, said plurality of wire bonds extending through the plurality of vias extending through then board; and connecting said board and master board using said plurality of electrical connectors on said board to said plurality of circuit traces on said master board.

---

38. The method of claim 37, wherein the plurality of electrical connectors comprise solder balls.

39. The method of claim 37, wherein the plurality of electrical connectors comprise pins.
